	How does a decision tree work as a learning algorithm?	Define concept learning.	Define Candidate Elimination Algorithm in machine learning.	Translate the following into First-Order Logic (FOL) and infer the conclusion: "All students are intelligent." "Alice is a student." Task: Translate into FOL Infer: "Alice is intelligent."	Frove whether the following expression is a tautology, contradiction, or contingent using a truth table: $(P \lor Q) \rightarrow (P \land Q)$ .	What is forward chaining?	that the sum is correct and no two letters have the same digit: (0–9) to each letter such that the sum is correct and no two letters have the same digit: A + A + A = BA.	Solve the following constraint and in (CSP)?	What is a Constraint Satisfaction Broken (Costs)	Define a heuristic function. Explain admissibility.		Section - B (10X2=20 Marks) Answer All Questions	d A single concept representing the best	A hypothesis space representing all b A decision tree representing all possible concepts b features.	angolium maintains:

	(Or)	Using the A* algorithm, find the shortest path from A to D, and show the steps including $f(n) = g(n) + h(n) \text{ for each node}$ (Or)	<ul> <li>E → D (Cost = 2)</li> <li>Using the A* algorithm, find the shortest path from A to D, and show the steps including f(n) = g(n) + h(n) for each node</li> <li>(Or)</li> </ul>	<ul> <li>C → E (Cost = 2)</li> <li>E → D (Cost = 2)</li> <li>Using the A* algorithm, find the shortest path from A to D, and show the steps including f(n) = g(n) + h(n) for each node</li> <li>(Or)</li> </ul>	e shortest path from A to D, and show the steps including  (Or)	<ul> <li>B → D (Cost = 3)</li> <li>C → D (Cost = 1)</li> <li>C → E (Cost = 2)</li> <li>E → D (Cost = 2)</li> <li>Using the A* algorithm, find the shortest path from A to D, and show the steps including f(n) = g(n) + h(n) for each node</li> <li>(Or)</li> </ul>	<ul> <li>A → C (Cost = 4)</li> <li>B → D (Cost = 3)</li> <li>C → D (Cost = 1)</li> <li>C → E (Cost = 2)</li> <li>E → D (Cost = 2)</li> <li>E → D (Cost = 2)</li> <li>Using the A* algorithm, find the shortest path from A to D, and show the steps including f(n) + h(n) for each node</li> <li>(Or)</li> </ul>	<ul> <li>A → B (Cost = 2)</li> <li>A → C (Cost = 4)</li> <li>B → D (Cost = 3)</li> <li>C → D (Cost = 1)</li> <li>C → E (Cost = 2)</li> <li>E → D (Cost = 2)</li> <li>Using the A* algorithm, find the shortest path from A to D, and show the steps including f(n) = g(n) + h(n) for each node</li> <li>(Or)</li> </ul>	Edges:  • A → B (Cost = 2)  • A → C (Cost = 4)  • B → D (Cost = 3)  • C → D (Cost = 1)  • C → E (Cost = 2)  • E → D (Cost = 2)  • Lysing the A* algorithm, find the shortest path from A to D, and show the steps including f(n) + h(n) for each node  (Or)	nodes A, B, C, D, E and their heuristic values (h): (A,10)  6 Ap e shortest path from A to D, and show the steps including  (Or)

(Or)  Represent the following scenario in Propositional Logic:  "If it rains, the ground will be wet. If the ground is wet, the grass will grow."  Use logical connectives and evaluate the truth of the conclusion "The grass will grow" based on the truth values of the premises.	Given the following knowledge base in First-Order Logic (FOL):  • ∀x (Human(x) → Mortal(x))  • ∀x (King(x) ∧ Greedy(x) → Evil(x))  • Human(John)  • King(John)  • Greedy(John)  • Greedy(John)  • Using the Forward Chaining algorithm, determine whether the following conclusions can be inferred:  1. Mortal(John)  2. Evil(John)  Clearly show the sequence of inferences made.	Given the following facts and rules:  If a person is guilty and has a motive, then they are a criminal.  West has a motive.  West is guilty.  Represent these statements in First-Order Logic (FOL).  Using the Backward Chaining algorithm, determine whether West is a criminal.  Draw the corresponding backward chaining tree and show the steps of reasoning.

23 b)		23 a)
i) Define inductive bias in Decision Tree learning. How does it affect the tree's ability to generalize from training data to unseen examples? Discuss its impact on model accuracy and performance.  ii) Define concept learning and explain the Find-S algorithm used to generalize concepts from training data. Provide a simple example to illustrate how the algorithm works in practice.	(0r)	i) List and explain the components of a learning system in machine learning. Discuss the role of each component in the learning process and how they contribute to building an effective machine learning model.  ii) Explain the Candidate Elimination algorithm and describe how it maintains the version space of hypotheses. How does this process help in refining the hypothesis to best fit the training data? Provide an example to demonstrate the concept.
